Install the Modelit Embedded Webserver Toolbox

The Embbedded Webserver toolbox makes use of Java. The Java classes that are needed by the toolbox are included in two .jar files:

1. .\java\MatlabHTTPserver.jar
2. .\java\MatlabHTTPclient.jar

These two .jar files must be included in static Java path.

Follow the steps below to add the .jar files to the static Java path.

1. Create therefore an ASCII text file and name the file javaclasspath.txt.
2. Add the name and full path to the the two .jar files in this text file.
3. Save the javaclasspath.txt file in your MATLAB startup folder (the folder in which startup.m for a specific project resides). Classes specified in this file override classes specified in the javaclasspath.txt file in the preferences folder.
4. Restart MATLAB.
